Portfolio Management Tool

User Experience Design

Project Overview

This endeavor aims to streamline the tool's interface, making it more intuitive and efficient for users. Through a comprehensive redesign, we prioritize enhancing user experience by addressing identified pain points and implementing modern design principles. Our goal is to create a user-friendly platform that simplifies project management, collaboration, and task tracking.

Problem Statement

The initial tool increment, functioning as a Minimum Viable Product (MVP), called for a significant revamp and redesign with a primary focus on improving the user experience (UX). This redesign aimed to better cater to user needs, align with the latest industry design trends, and enhance the overall usability and satisfaction for our users.

Challenges with existing platform

- Lack of information for the user
- Complex flows leading to dead ends without any exits
- No guide for the user to navigate the tool
- Unefficient information hierarchy and design architecture
- Inconsistent design patterns and visual style

Scope of Work

UX Audit
Audited existing tools in detail to discover usability issues, pattern inconsistencies and journey problems.

UX Design
Designed keeping in mind the insights from the UX audit, customer feedback, and business requirements.

Design System
Designed keeping in mind the insights from the UX audit, customer feedback, and business requirements.

Visual System
Defined color standards, visual patterns, and typographical systems to ensure consistency across the platform.

Our Design Process

Project Audit

We conducted a deep and detailed audit for the existing tool to understand the current user journey of the product. This helped us understand the existing usability issues and draw insights for the upcoming design solutions.

Analysis and Insights

Frequent dead ends

The existing designs had multiple flows which lead to a dead end. This lead to confusion and increased cognitive load.

Same action different pattern.

Design pattern standardization become extremely important. Same actions contained different patterns within the same tool.

Visual Styling

It become important to bring the tool to the market standards of visual style and experience design. Tools without a trustworthy experience have a clear disadvantage in the markets.

Lack of insights about the user

The primary users of the tools were Product leads, Management leads, and higher company leadership team but we had very little information about what they are tying to achieve via this tool.

Too much cognitive load

Due the nature and complexity of the tool, the user journey lead to huge amounts of cognitive load as the flows were not intuitive and contained very less information for the users to navigate.

Final Designs

#Dashboard

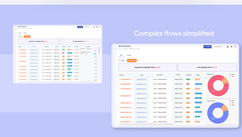
Clean and intuitive UI

The final design showcases a new visual design with simplified flow and journeys that are intuitive for the user.

Complex flows simplified

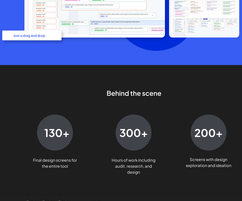
Complex flows simplified

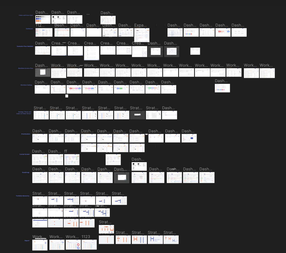
#Roadmaps



Behind the scene

130+
Final design screens for the entire tool

300+
Hours of work including audit, research, and design




200+
Screens with design exploration and ideation
