# What is For Each?

In JavaScript, `forEach` is a method that allows you to loop through each element in an array and perform a specific action on each element. It's like going through a list of items and doing something with each item.

## Let's Understand with Example:

Imagine you have a list of fruits (an array) in a basket, and you want to say "I have [fruit name]" for each fruit in your basket.

```
const basket = ['apple', 'banana', 'cherry', 'date'];

basket.forEach(function(fruit) {
  console.log('I have ' + fruit);
});
```

## Explanation of Previous Slide Code:

- The **forEach** method is used on the basket array.
- It goes **through each fruit** in the basket one by one.
- For each fruit, it **performs the action inside the function**, which is to print "I have [fruit name]" to the console.
