

CSS BOX SHADOW CHEATSHEET

Worth it! 🚀

Hey, devs!

Here's a **complete Cheatsheet** for CSS
Box Shadow. Enjoy!

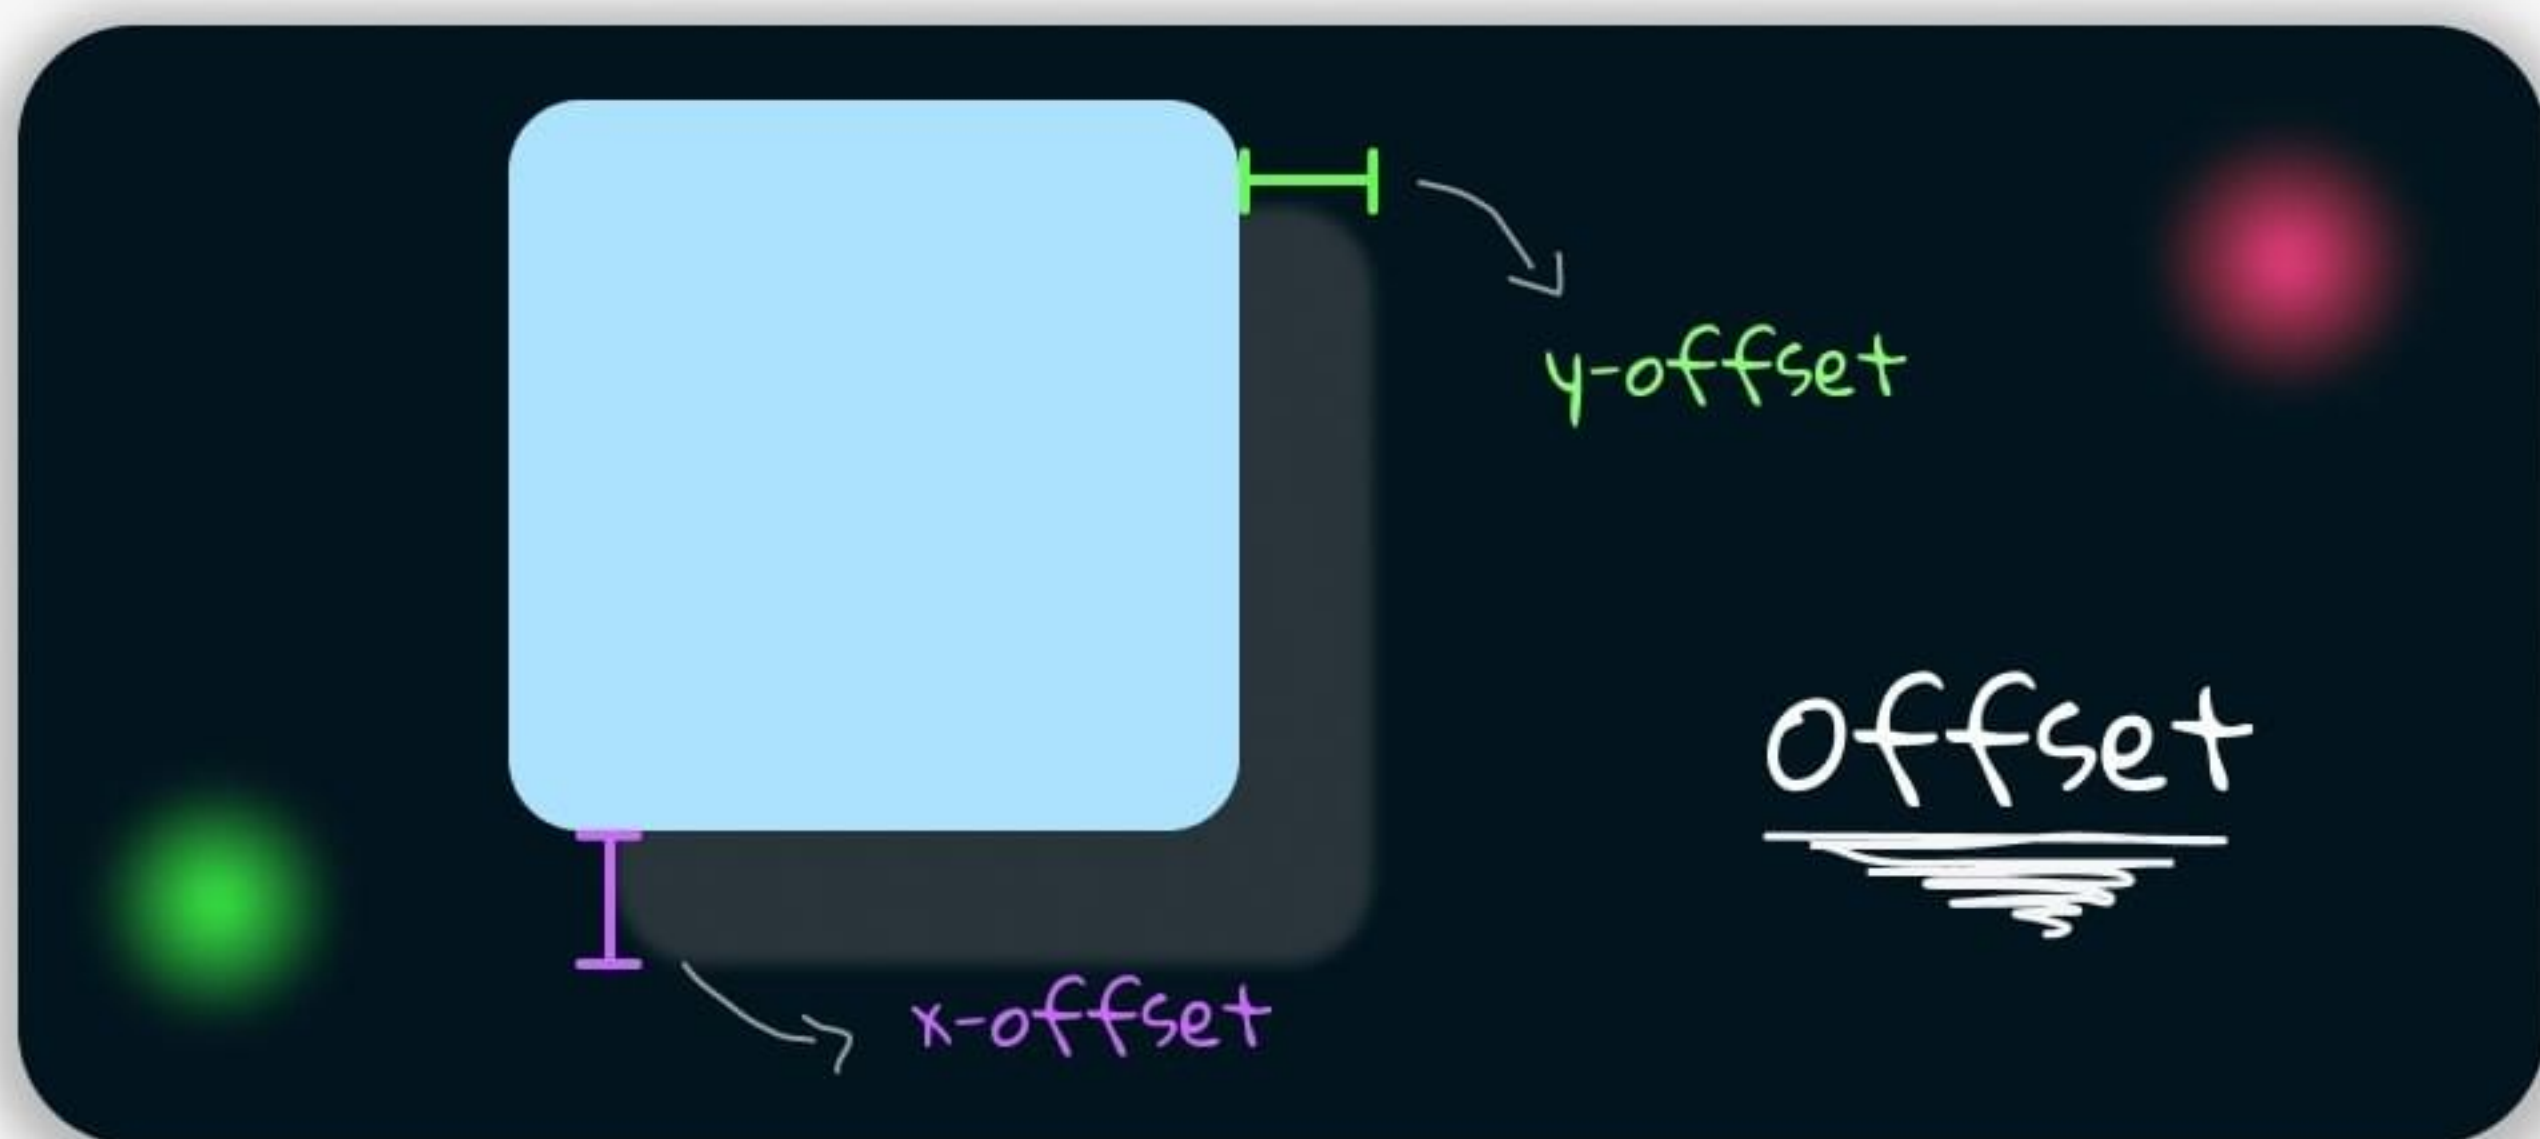

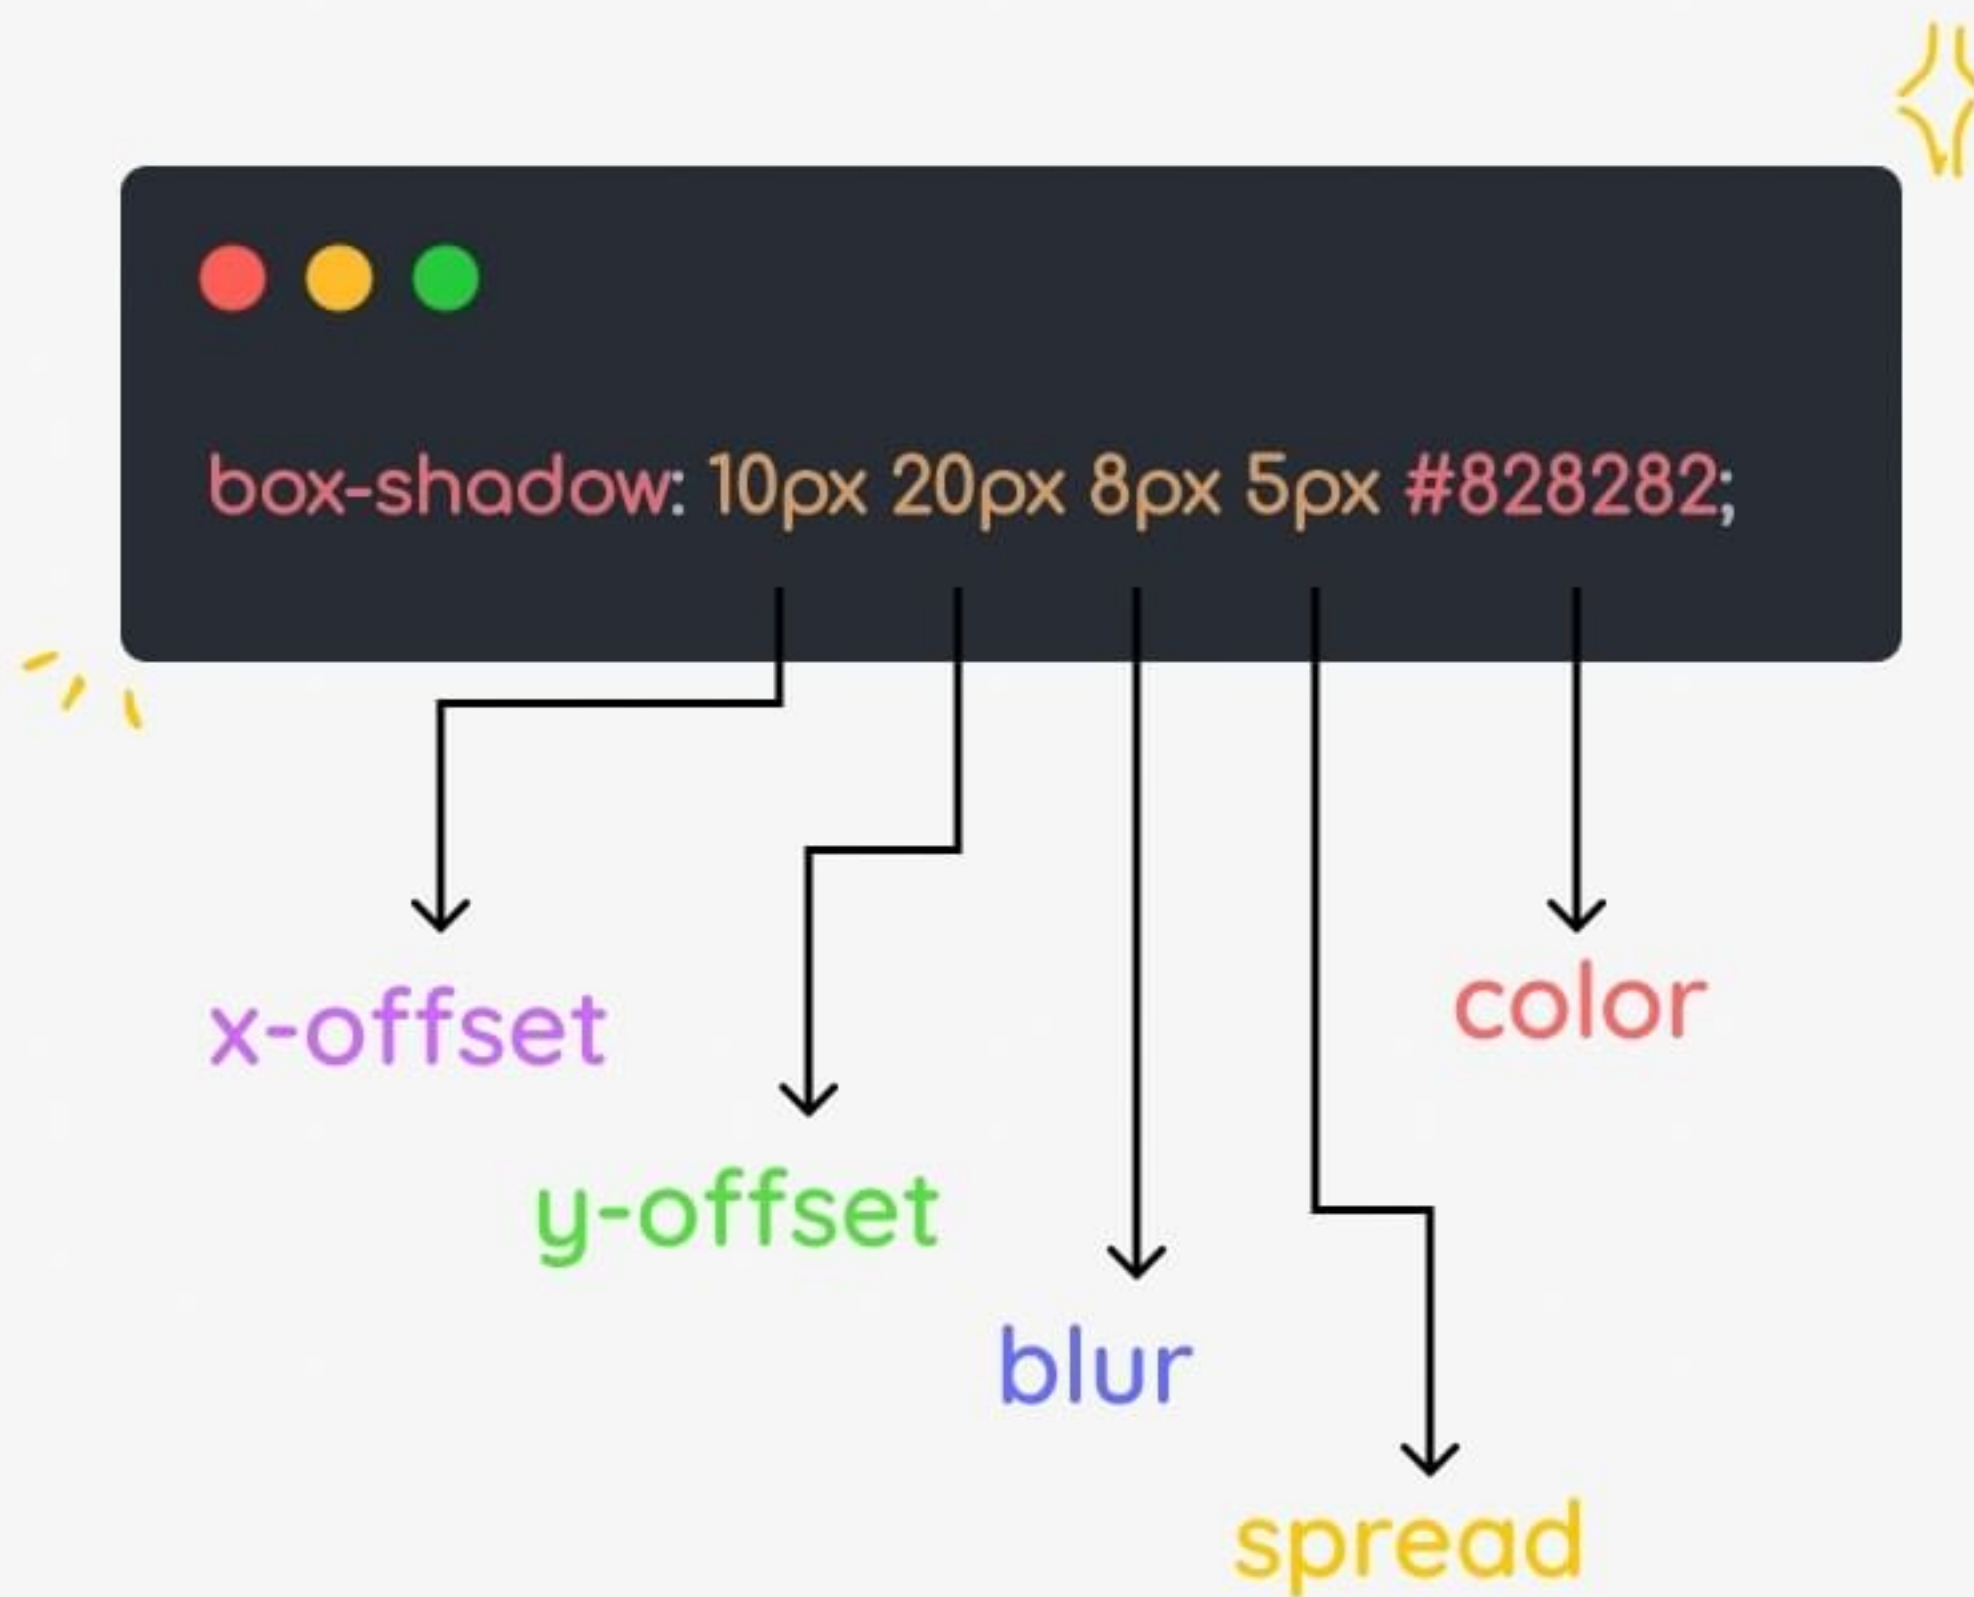

Almost every HTML element
is supported

Box Shadow is a CSS Property
that creates shadows from
HTML Elements!

Swipe!

```
box-shadow: 10px 20px 8px 5px #828282;
```

Blur

Negatives aren't allowed!

Defines how blurry is the shadow going to be

The larger the value, the bigger and lighter the shadow's going to be

`blur: 0px;`

`blur: 10px;`

`blur: 30px;`

Spread[👑]

Is value 0? Then Spread
will affect nothing

Defines how much space will the shadow take

Positive values will make
the shadow expand;
negative values, shrink.

`spread: 0px;`

`spread: 10px;`

`spread: 30px;`

Multiple Shadows

```
box-shadow: inset 0 0 0 0 #fff;  
           10px 20px 8px 5px #828282;
```

The inset shadow is acting as a border, while the one below is acting as the shadow

Recommendations

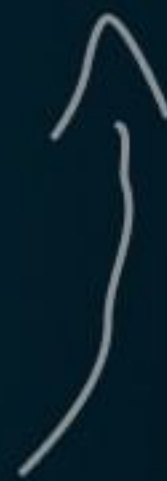

Always choose dark (but light) colors

Use a low opacity

Don't exceed with blur

Use shadows to the same side

Would help
a lot! <3

Thanks for
reading! ✨

Did you find the hidden "🍀"?
