Smooth Scroll in CSS:

This CSS property enables smooth scrolling behavior for anchor links on the same page.

```
html {  
  scroll-behavior: smooth;  
}
```

Contenteditable Attribute:

Adding contenteditable to an HTML element makes it editable by the user. It's often used to create rich text editors or interactive content areas.

```
<div contenteditable="true">  
  This content can be edited by the user.  
</div>
```

Prevent Pasting Content:

You can prevent users from pasting content into a contenteditable area using JavaScript:

```
document.getElementById('input').addEventListener('paste', (e) {  
  e.preventDefault();  
});
```

CSS Variables:

CSS variables make your styles more maintainable and dynamic. You can change the color of the entire website just by modifying its variable color.

```
:root {  
  --main-color: #3498db;  
}  
.element {  
  color: var(--main-color);  
}
```

Custom Cursor:

You can change the cursor appearance to create a custom user experience.

```
body {  
  cursor: url('custom-cursor.png'), auto;  
}
```

Custom Scrollbars:

You can style your scrollbars with the `::-webkit-scrollbar` pseudo-elements.

```
::-webkit-scrollbar {  
  width: 12px;  
}  
::-webkit-scrollbar-thumb {  
  background-color: #3498db;  
}
```
