# REACT 19

# A FORWARD LEAP

*For Developers*

Everything you  
need to know in  
one place

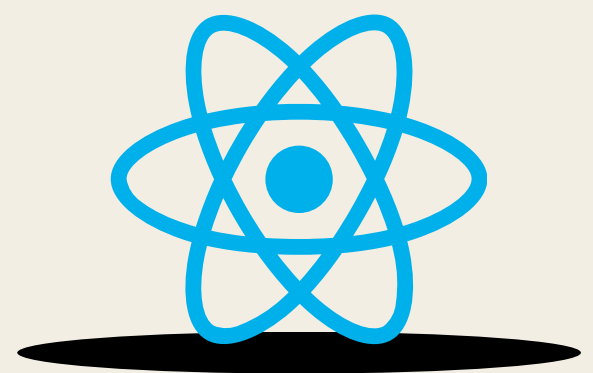

T H E

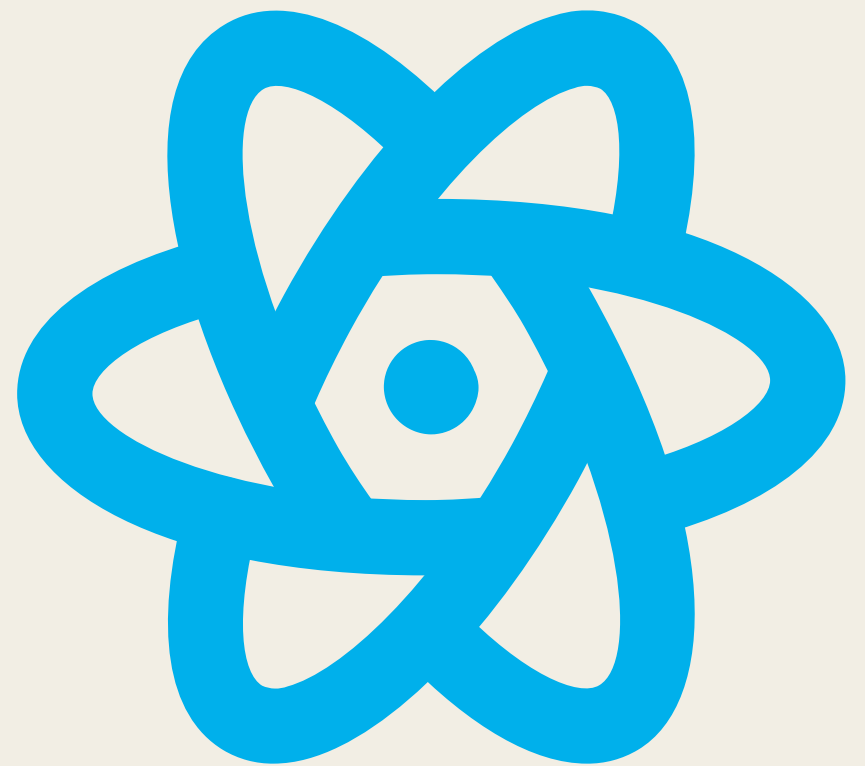

# REACT COMPILER

First off, we have a compiler. This is a tool that turns React code into normal JavaScript, making everything work up to two times faster. It's like making your code speed up like a fast car. For now, using it is optional, but it will become the usual way React operates later on.

# ACTIONS

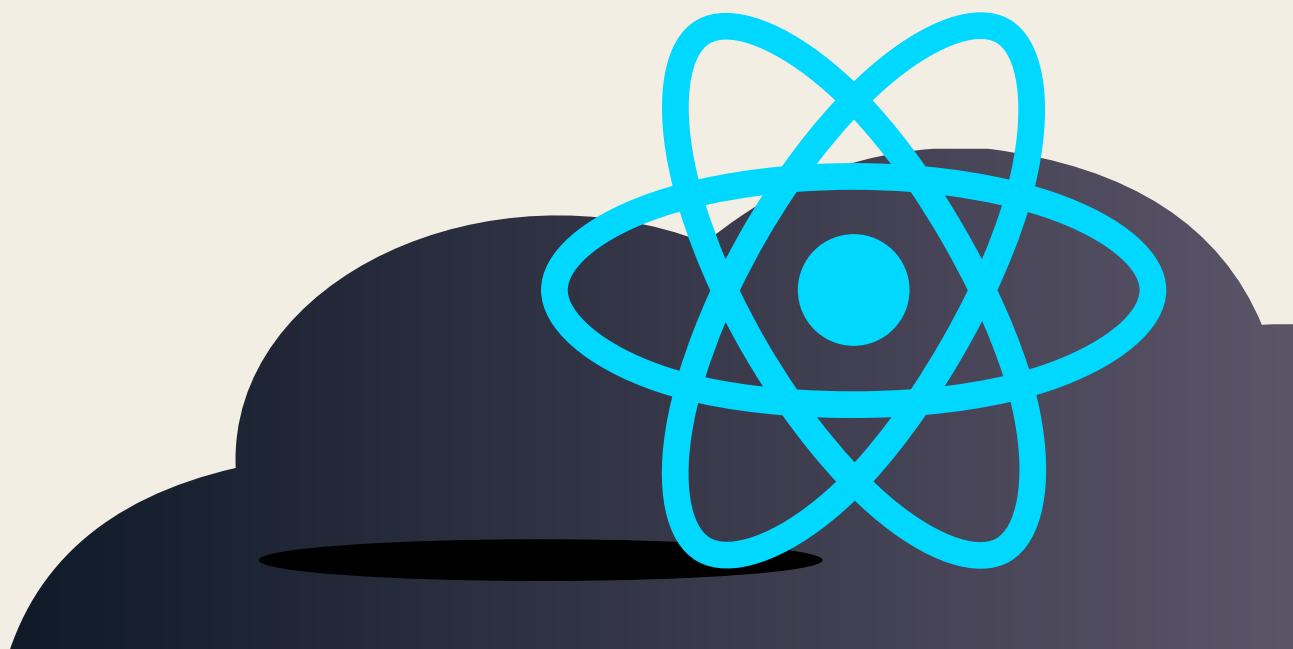

Actions are a new feature for managing stuff like forms on your website. They help you change your page's information when someone completes a form, without making things complex. This is really useful for keeping it all straightforward.

# SERVER COMPONENTS

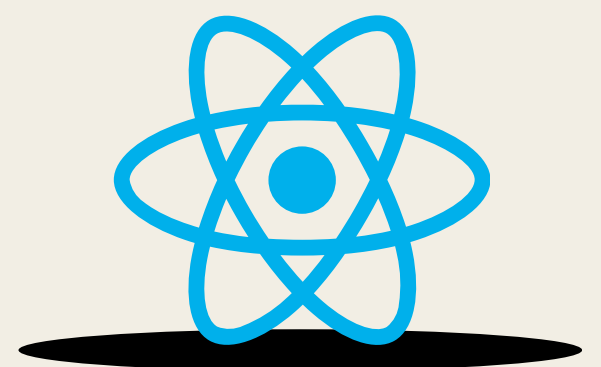

These parts work on the server first and then send the finished page to the user. This makes your website load faster, improves how search engines see it, and deals with data more easily.

# ASSET LOADING

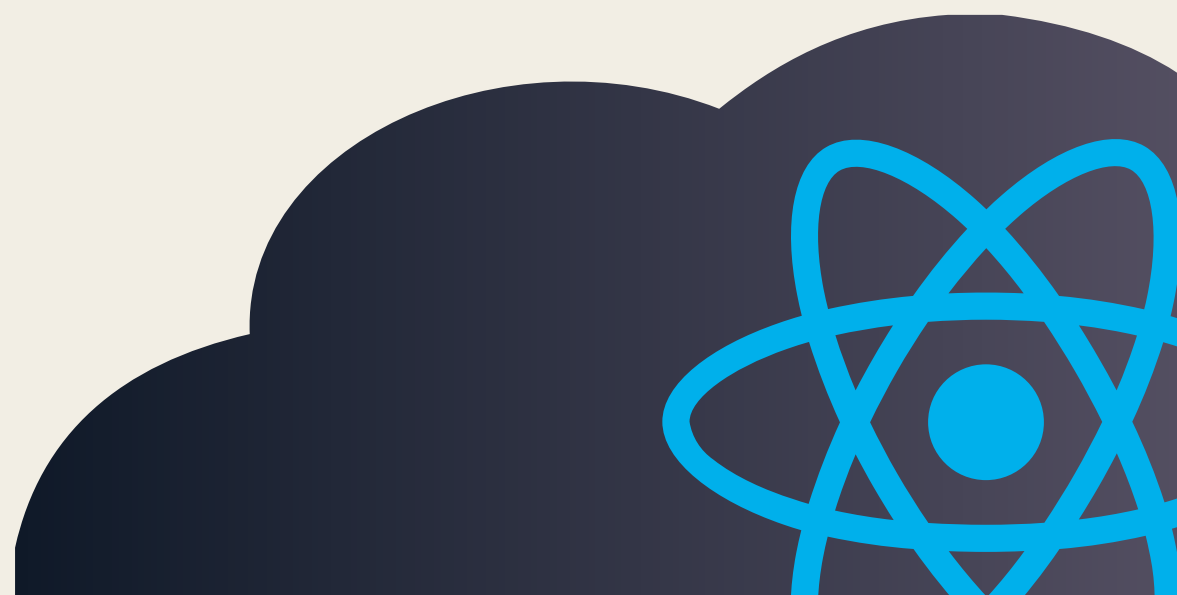

React 19 helps your images and files load quicker by starting to load them in the background while users are still on the current page. This means people wait less when they go to a new page.

# DOCUMENT METADATA

Now, it's easy to add titles and meta tags to your pages with a new component called `<DocumentHead>`. This improves SEO and ensures your brand is consistent across your site, without repeating the same code on every page.

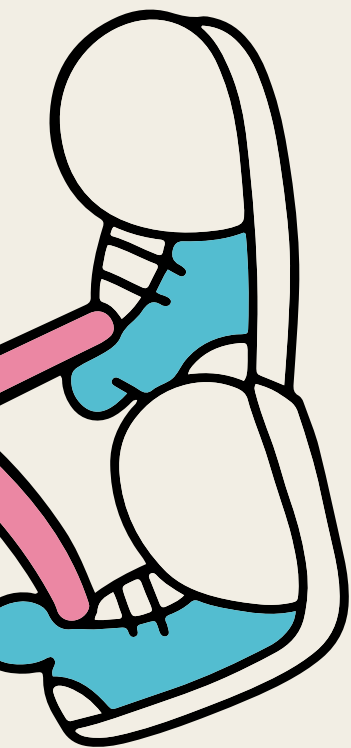

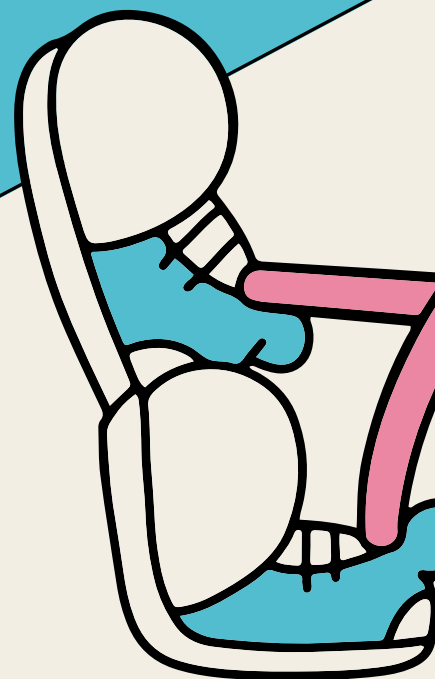

# WEB HIXIS COMPONENTS

React now gets along better with Web Components, making it simpler to combine different parts of your website. This is great for using React in spots where it wasn't possible before.

# ENHANCED HOOKS

Hooks have improved, offering you more power over the timing of your code's running and updating. This helps your website run better and simplifies coding. React 19 introduces many enhancements that streamline website development, reducing hassle. With quicker code via the new compiler, simpler form management, and smoother content loading, there's much to look forward to.
